

Project Title

PENNYWISE: AI Powered Financial Tracker

Team Name

TechTitans

Problem Statement

Living in urban areas has steadily become more challenging because of the rising cost and standard of living. People do not just spend a lot of money on daily needs such as food, transportation but also on non-necessities such as subscriptions services, and online shopping, sometimes without even realizing it. This shows the importance of managing personal finances. However, many people still struggle to keep track of their expenses because most financial tracking methods feel troublesome and time consuming. Users often forget to record their spending or feel lazy to manually enter every expense into an app. Over time, this can lead to overspending, poor saving habits, and financial stress. Therefore, there is a need for a smarter and more convenient solution that can help users track their expenses easily while also encouraging better financial habits in their daily lives.

How does the project work?

The application begins with a login page where users can sign in or create a new account to access the system securely. After logging in, users will be brought to the main dashboard, where they can view their spending summary, recent expenses, and overall financial activity.

To make expense tracking easier, the app provides several options for users to record their spending. Users can manually enter their expenses, scan receipts using the camera to quickly or record purchases without needing to type everything themselves. When scanning receipts, the OCR feature automatically reads important details such as item names, prices, and total amounts, making the process faster and more convenient.

After the expenses are recorded, the application automatically organizes the spending into categories like food, transportation, shopping, and entertainment. At the same time, the app can track locations where users often spend money and send reminders when needed to encourage better spending awareness.

Based on the collected data, the AI system analyzes users spending habits and generates charts, reports, and spending summaries that are easy to understand. The app also provides personalized

Hackathon MAY 26

saving tips and recommendations to help users manage their money more wisely. In the end, users can monitor their financial progress anytime through the dashboard before exiting the application.

Features and Functions

Money Tracker AI is built to make managing money feel easier and less stressful for users. Instead of forcing users to manually record every single expense, the app provides smarter and more convenient ways to track spending in daily life.

One of the main features of the app is the Location Based Reminder. For example, when a user spends a long time at places like shopping malls, restaurants, or cafes, the app will automatically send a reminder to encourage them to keep track of their spending. This helps users become more aware of their financial habits without needing to constantly remember everything themselves.

The app also includes Notification Tracking, which helps users track payments made through e-wallets or online shopping platforms. This reduces the need for manual input and makes expense tracking much faster and more convenient.

Besides that, Money Tracker AI also comes with basic financial management features such as user login, expense tracking, and spending analysis through charts and graphs. These features allow users to clearly see where their money is going and better understand their spending patterns.

To make the experience even easier, the app uses AI-powered features such as receipt of scanning and voice input. Users can simply scan a receipt using the camera or record expenses through voice commands instead of typing everything manually. The AI system will then analyze users' spending behavior and provide personalized suggestions and saving tips to help users spend more wisely and manage their finances better.

Technologies Used

Money Tracker AI is built using several modern technologies to make the app smarter, easier to use, and more convenient for users in their daily lives. The application is developed using Flutter, which helps create a smooth and user friendly interface that can work across different devices. For the backend system, Firebase is used to manage user login, store financial data securely, and keep user information updated in real time.

To make expense tracking faster and less troublesome, the app uses OCR (Optical Character Recognition) technology. This allows users to simply scan receipts using their camera instead of typing every expense manually. The app can automatically detect important details such as item names and prices from the receipt.

The app also uses location tracking features to help users become more aware of where they spend most of their money. Based on the collected data, the system can generate charts, reports, and spending heatmaps to help users better understand their spending habits.

Overall, these technologies work together to create a smarter and more user friendly financial tracking experience that encourages better money management habits.
